Statistical Inference Course Project - Basic inferential data analysis

Yuan Liao

8/26/2020

Overview

This is an R Markdown document for Statistical Inference Course Project - part 2. Here, we're going to analyze the ToothGrowth data in the R datasets package.

```
# Load necessary libs
library(ggplot2)
```

Load data for exploratory data analysis

Load data and take a look.

```
# Load necessary libs
data('ToothGrowth')
summary(ToothGrowth)
```

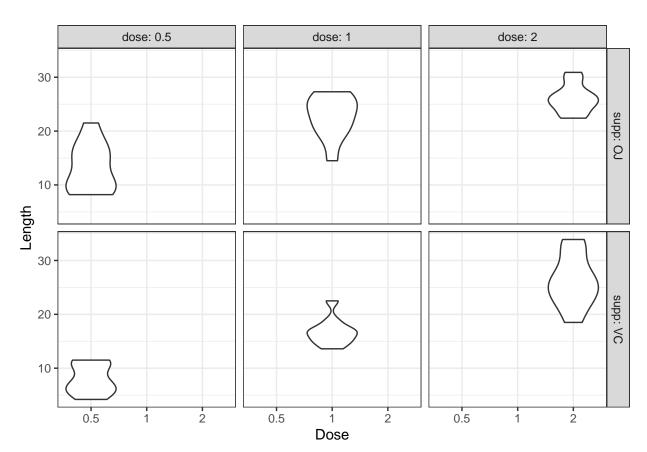

```
##
        len
                   supp
                                dose
   Min.

```

Show the unique values.

```
# Load necessary libs
for (v in names(ToothGrowth)) {
  print(unique(ToothGrowth[, v]))
}
```

```
## [1] 4.2 11.5 7.3 5.8 6.4 10.0 11.2 5.2 7.0 16.5 15.2 17.3 22.5 13.6 14.5 ## [16] 18.8 15.5 23.6 18.5 33.9 25.5 26.4 32.5 26.7 21.5 23.3 29.5 17.6 9.7 8.2 ## [31] 9.4 19.7 20.0 25.2 25.8 21.2 27.3 22.4 24.5 24.8 30.9 29.4 23.0 ## [1] VC OJ ## Levels: OJ VC ## [1] 0.5 1.0 2.0
```

```
# Take a look at the data
ggplot(ToothGrowth, aes(x=factor(dose, levels = c(0.5, 1.0, 2.0)), y=len, group=factor(dose, levels = c
geom_violin(aes(fill=len)) +
facet_grid(supp ~ dose, labeller=label_both) +
labs(x='Dose', y='Length') +
theme_bw()
```

Compare tooth growth by supp and dose

Two-sample t test is applied to compare the impact of supp and dose on len with confidence interval = 95%.

Hypothesis 1: two supplement groups have different distributions of tooth length

```
t.test(len~supp,data=ToothGrowth)
##
```

```
## Welch Two Sample t-test
##
## data: len by supp
## t = 1.9153, df = 55.309, p-value = 0.06063
## alternative hypothesis: true difference in means is not equal to 0
## 95 percent confidence interval:
```

```
## -0.1710156 7.5710156

## sample estimates:

## mean in group OJ mean in group VC

## 20.66333 16.96333
```

It turns out that p-value is 0.06 which is greater than 0.05. Therefore, the hypothesis is rejected.

Hypothesis 2: dose = 0.5 and does = 1 have different distributions of tooth length

```
t.test(len~dose,data=ToothGrowth[ToothGrowth$dose %in% c(0.5, 1),])
##
##
   Welch Two Sample t-test
##
## data: len by dose
## t = -6.4766, df = 37.986, p-value = 1.268e-07
## alternative hypothesis: true difference in means is not equal to 0
## 95 percent confidence interval:
## -11.983781 -6.276219
## sample estimates:
## mean in group 0.5
                      mean in group 1
##
              10.605
                                19.735
```

It turns out that p-value < 0.001. Therefore, the hypothesis is accepted.

Hypothesis 3: dose = 0.5 and does = 2 have different distributions of tooth length

```
t.test(len~dose,data=ToothGrowth[ToothGrowth$dose %in% c(0.5, 2),])
```

```
##
## Welch Two Sample t-test
##
## data: len by dose
## t = -11.799, df = 36.883, p-value = 4.398e-14
## alternative hypothesis: true difference in means is not equal to 0
## 95 percent confidence interval:
## -18.15617 -12.83383
## sample estimates:
## mean in group 0.5 mean in group 2
## 10.605 26.100
```

It turns out that p-value < 0.001. Therefore, the hypothesis is accepted.

Hypothesis 4: dose = 1 and does = 2 have different distributions of tooth length

```
t.test(len~dose,data=ToothGrowth[ToothGrowth$dose %in% c(1, 2),])
```

```
##
## Welch Two Sample t-test
##
## data: len by dose
## t = -4.9005, df = 37.101, p-value = 1.906e-05
## alternative hypothesis: true difference in means is not equal to 0
## 95 percent confidence interval:
## -8.996481 -3.733519
## sample estimates:
## mean in group 1 mean in group 2
## 19.735 26.100
```

It turns out that p-value < 0.001. Therefore, the hypothesis is accepted.

Conclusions

With the below assumptions:

- 1. The analyzed data respresent the true population.
- 2. Multi-level comparison is approximated by a series of two-sample t tests.
- 3. Ignore the interaction between supplement and dose on tooth length.
- 4. Sample/population data follow normal distribution.

There is no effect of supplement on tooth length. The higer the dose, the greater the tooth length.
